in this work the interaction between the higgs boson and the top quark is studied with the proton proton collisions at 13 tev provided by the lhc at the cms detector at cern geneva at the lhc these particles are produced simultaneously via the associate production of the higgs boson with one top quark th process or two top quarks tth process compared to many other possible outcomes of the proton proton interactions these processes are very rare as the top quark and the higgs boson

are the heaviest elementary particles known hence identifying them constitutes a significant experimental challenge a high particle selection efficiency in the cms detector is therefore crucial at the core of this selection stands the level 1 l1 trigger system a system that filters collision events to retain only those with potential interest for physics analysis the selection of hadronically decaying  $\tau$  leptons expected from the higgs boson decays is especially demanding due to the large background arising from the qcd interactions the first part of this thesis presents the optimization of the l1  $\tau$  algorithm in run 2 2016 2018 and run 3 2022 2024 of the lhc it includes the development of a novel trigger concept for the high luminosity lhc foreseen to start in 2027 and to deliver 5 times the current instantaneous luminosity to this end sophisticated algorithms based on machine learning approaches are used facilitated by the increasingly modern technology and powerful computation of the trigger system the second part of the work presents the search of the th and tth processes with the subsequent decays of the higgs boson to pairs of  $\tau$  lepton w bosons or z bosons making use of the data recorded during run 2 the presence of multiple particles in the final state along with the low cross section of the processes makes the search an ideal use case for multivariant discriminants that enhance the selectivity of the signals and reject the overwhelming background contributions the discriminants presented are built using state of the art machine learning techniques able to capture the correlations amongst the processes involved as well as the so called matrix element method mem which combines the theoretical description of the processes with the detector resolution effects the level of sophistication of the methods used along with the unprecedented amount of collision data analyzed result in the most stringent measurements of the th and tth cross sections up to date
